17 Beans, Bountiful

28 Beans, Black Valentine Stringless

30 Beans, Topcrop

20 Bean, Wade

30 Topcrop

Recent Gold Medal winner in All-America Selections. Topcrop was developed by Dr. Zaumeyer of the U.S.D.A. and is a result of crossing Full Measure and Refugee No. 5. Its outstanding characteristics are earliness and productivity. In a recent Experiment Station test Topcrop averaged 262.2 bushels per acre compared with 197.8 bushels per acre for Tendergreen. Plants are mosaic resistant and pods are very round, 5½ to 6 inches long, tender, meaty. 51 days. Prices: Pkt. 15c; ½ lb. 40c; lb. 70c; 2 lbs. \$1.20; 3 to 9 lbs. @ 50c lb.; 10 to 24 lbs. @ 42c lb., postpaid.

Bean Culture:

Beans are sensitive to both cold and wet. Plant when ground is warm. For a continuous supply plant every two weeks til the last of August; farther South even later. Make the rows 2 to 3 feet apart, drop the beans 3 to 4 inches apart and cover 1½ to 2 inches deep. Give frequent but shallow cultivation up to blossoming time, not afterwards and never when the plants are wet. One pound plants 100 feet; 60 lbs. will plant an acre. Wyatt's Garden Beans are produced in Idaho from the finest stock seed. Where rust or anthracnose is a problem, dust or spray with Parzate.

17 Bountiful

Bountiful is practically rust mildew proof, very hardy, extremely early. The pods are large, rich green in color, almost flat and straight. They are uniform in shape, solid, meaty, tender and delicious. 48 days. Prices: Pkt. 15c; ½ lb. 40c; lb. 70c; 2 lbs. \$1.15; 3 to 9 lbs. @ 48c lb.; 10 to 24 lbs. @ 40c lb., postpaid.

20 Wade (U.S.D.A. B-1515-1-7-1-2)

While it is several days later than some of the earliest varieties, Wade has a high rating in almost every bean use. The plants, resistant to Common and Southern Bean Mosaic and Powdery Mildew, stand (20 to 24 inches) well above all other bush varieties in the trial plots and are deeper green. Pods are long (6½ to 7 inches) straight, round, quite smooth and very dark green. This fine appearance, coupled with the fact that the picked beans are classed as slow wilting, should make it an important shipping variety. It has been given an excellent rating for freezing. While not the highest yielding bean, Wade ranks in yield well above many important commercial varieties, an example being its 219.9 bu. per acre yield as compared with Tendergreens 197.8 bu. per acre in a N. C. Experiment Station test. We are glad to be one of the comparatively few seedsmen receiving our stock seeds directly from the U. S. Regional Vegetable Breeding Laboratory, Charleston, South Carolina. 64 days. Pkt. 15c; ½ lb. 45c; lb. 75c; 2 lbs. \$1.30; 3 to 9 lbs. @ 54c lb.; 10 to 24 lbs. @ 46c lb., postpaid.

Cold hardy—plant spring and fall

CULTURE: Sprouting or heading varieties are seeded in June for July transplanting and winter heading, or in frames from October to January for early spring transplanting. Cultivate the same as cabbage or cauliflower and $\frac{1}{2}$ lb. of seeds are required per acre. The Salad Broccoli is cultivated like turnips and 1 ounce of seed will drill 100 ft.; 2 lbs. of seeds per acre.

The head is a compact cluster of tightly closed flower buds and resembles cauliflower only in shape. When the central head is cut, numerous sprouts develop from the leaf axis, each sprout terminating in small green separate heads. These are cut in lengths of 10 to 12 inches. Served in the same way as asparagus, they form a very tasty and nourishing dish. June seeded plants transplanted in July provide a welcome mid-winter crop in this latitude. 90 days. Prices: Pkt. 15c; oz. 40c; $\frac{1}{4}$ lb. \$1.05, postpaid.

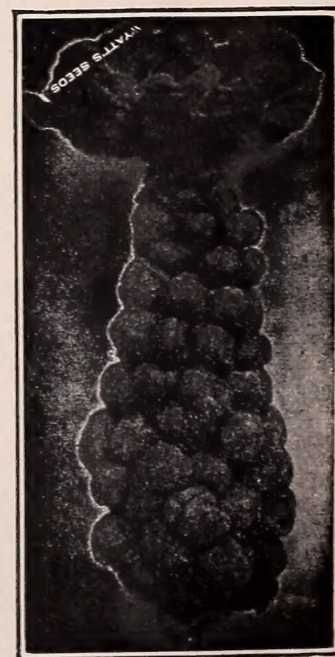

143 Broccoli Salad This variety has become popular in the eastern part of North Carolina. It is planted in the fall, and in growth somewhat resembles the Seven Top Turnip. Vegetable Planting Calendar

Many otherwise successful gardeners lose months of valuable production because of a failure to realize the cold hardness of a number of the most popular and productive vegetables.

By successive plantings beet, broccoli, cabbage, carrot, chard, kale, mustard, onion, parsley, radish, spinach and turnip (salad or root) can be kept in production, out-of-doors and without protection winter or summer, every day in the year in this isothermal zone.

The planting information shown in the chart on this page is the result of careful preparation and years of actual gardening experience. Planting dates shown for tender varieties are

based on the average U. S. Weather Bureau records of the last killing frost in the spring and the first killing frost in the fall in this zone, for the past 50 years

Throughout our catalog we have endeavored to give the approximate number of days to maturity for all varieties. This information should be helpful, especially in determining the latest safe date to plant tender varieties in the summer or fall, in order to make a crop before frost.

Soil conditions permitting, we recommend planting on or immediately after the average date of the last frost in the spring, otherwise spring rains may delay planting days or weeks.

"TESTED SEEDS"

The term "tested seeds" as used in this catalog, and in all of our advertising means that every bag or package of seeds purchased at Wyatt's is supplied from a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or for sale in bulk. This accounts for the fact that "Wyatt's Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt's Tested Seeds and be sure of success.

FERTILIZERS AND SOIL CONDITIONERS

Monsanto
Krilium*
SOIL CONDITIONER
Special **MERLOAM** Formulation

KRILIUM—the Soil Conditioner

Krilium—a synthetic chemical—which “bonds” the tiny clay particles into aggregates of the proper size which prevents breaking down.

Benefits of Improved Soil Structure: Water enters the soil more easily, penetrating to the root zone—where it is needed.

Seedlings germinate and emerge more easily in loose soil. Root growth is improved because rootlets do not have to struggle through dense soil. Beneficial soil bacteria have a better chance to perform their needed functions.

Recommended usage—5 lbs. Krilium treats 40 square feet of garden soil six inches deep; or 5 lbs. to treat 80 square feet three inches deep. These amounts will treat the hardest crusted soil.

MERLOAM (25% Krilium) 1 lb. can \$1.70; 5 lb. can \$5.40, postpaid. Not prepaid, 1 lb. can \$1.39; 5 lb. can \$4.95.

LOAMAKER (100% Krilium) 10 lb. can \$25.65; 25 lb. drum \$60.00; 50 lb. drum \$114.40, postpaid. Not prepaid, 10 lb. can \$25.00; 25 lb. drum \$58.75; 50 lb. drum \$112.50.

DUPONT SOIL CONDITIONER

A concentrated product to be dissolved in water, 1 oz. per gallon, for application to the surface of a well prepared soil area, 12 sq. ft. 4 ozs. \$1.50; 8 ozs. \$2.20; 2 lbs. \$7.10, postpaid. Not prepaid; 4 ozs. \$1.25; 8 ozs. \$1.95; 2 lbs. \$6.75.

To have a healthy garden you must first have healthy soil. Don't waste time, seed and fertilizer on poor soil. Premier Peat Moss, 97% organic, gives your soil loam-like texture, making it more productive. It absorbs 20 times its own weight in moisture . . . loosens and aerates heavy soil . . . adds body to light soil . . . prevents leaching. Water and fertilizer penetrate deeply, feeding the roots as needed.

Remember, your garden can be no better than your soil. Get Premier Peat Moss, with the certified seal.

For new lawns 1 bale should be thoroughly pulverized and mixed in each 100 to 200 sq. ft. of lawn area. Nothing is so beneficial to establish lawns as a bale of peat mixed with 100 pounds of Sheep Manure applied to each 2,000 sq. ft. 3 or 4 times each summer. Peat should also be used liberally in gardens, flower beds and borders, and as a mulch for shrubbery, because of its capacity to hold moisture. Prices: Large Bale 18" x 20" x 39" \$4.95; Handy Bale 18" x 14" x 30" \$3.50.

Ten Steps in Lawn Building

- 2—Apply the equivalent of 3 heavy green cover crops or 3 inches weed free manure or both if available.
- 3—Apply lime as needed up to 50 lbs. per 1,000 sq. ft. and fertilizer 50 lbs. per 1,000 sq. ft.

- 8—Compost clippings with liberal amount of sand and return to lawn in light applications as mulching during summer.
- 9—Feed at 8 weeks intervals, year 'round, with 20 to 40 lbs. per 1,000 sq. ft., high grade fertilizer or 50 to 100 lbs. per 1,000 sq. ft. sheep manure, or both. Always sprinkle after feeding.

MORNING GLORIES

IPOMEAS. In growing Ipomeas (Morning Glories and Moonflowers), never plant until the soil is thoroughly warm. To aid germination of particularly hard-seeded varieties filing a small notch at the top of the seed will help considerably.

Always select the driest, sandiest part of the garden and sow where the plants are to flower as the Ipomeas resent transplanting. Plants should be kept on the dry side in order to induce early and abundant flowering with a rather sparse growth of foliage.

Sow the small seeds in a warm, sunny, open place outdoors, thinning to 15 inches apart, or in frames for transplanting. Scatter seeds thinly, barely cover and firm soil over them; water seedlings with a fine spray to prevent drying out. The weakest looking seedlings usually produce the finest flowers, so save the weak plants for transplanting. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

WYATT'S RECLEANED CLOVER SEEDS

F97 Alfalfa

F97 Alfalfa (Oklahoma) Lowest Prices in Years! While Alfalfa is a relatively expensive crop, the first cutting usually returns about double the cost of seeds, lime, fertilizer and planting. A good method is to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed. Use 20 to 35 pounds (not more) borax per acre and drill August 20 to October 1, or February 15 to March 25, 25 to 40 pounds of thoroughly inoculated seeds per acre. Roll or culti-pack after seeding. At seeding time use 1,200 pounds 2-12-12 and 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before $\frac{1}{4}$ flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production. We handle only premium quality seeds. Prices: lb. 85c; 2 to 9 lbs. 65c per lb.; 10 to 59 lbs. 52c lb., postpaid. Not prepaid, 10 to 59 lbs. at 50c; 60 lbs. or more at 40c lb.

F95 Atlantic Alfalfa N. C. Experiment Station reports up to a fifth more production with Atlantic than with other adapted strains, following good practices. We offer premium quality seeds of the highest purity. Prices: lb. 85c; 2 to 9 lbs. @ 67c; 10 to 59 lbs. @ 54c, postpaid. Not prepaid 10 to 59 lbs. @ 52c; 60 lbs. or more @ 42c lb.

F96 Buffalo Alfalfa Buffalo Alfalfa, slightly more winter hardy and adapted anywhere Kansas Common is grown, was developed at the Kansas Agricultural Experiment Station from an old strain of bacterial resistant Kansas Common Alfalfa which had been under observation since 1922. It is the most resistant to wilt of all alfalfas for this area. Yields the first 2 or 3 years after planting are about the same as Common. After this period Buffalo maintains a good productive stand while the common strains drop off sharply to $\frac{1}{3}$ or $\frac{1}{4}$ stand. We offer only the purest seeds from the original selection. Prices: lb. 95c; 2 to 9 lbs. @ 72c lb.; 10 to 59 lbs. @ 62c lb., postpaid. Not prepaid 10 to 59 lbs. @ 55c lb.; 60 lbs. or more @ 50c lb.

F94 Rowan Lespedeza A new high yielding variety of Korean Lespedeza, resistant to powdery mildew and two common forms of rootknot nematode. In N. C. its superior yielding ability has been particularly striking on nematode infested soils, where in trials, it has doubled the yield of Korean. On nematode free soils, differences have not been as great, but it is considered superior to common Korean where nematodes are not a problem. Rowan is not resistant to all forms of nematode. It is adapted throughout the Korean belt and matures about the same time as Korean. In the tidewater area, Kobe is still recommended. Prices: lb. 85c; 2 to 9 lbs. @ 65c lb.; 10 to 24 lbs. @ 52c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 45c lb.; 25 to 99 lbs. @ 42c lb.; 100 lbs. or more @ 40c lb.

Recommended by Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 30 to 40 lbs. per acre. Responds to liming and fertilizing. Write for prices.

F92 Korean Lespedeza Does best in heavy soils. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. Korean is earlier than other lespedezas, enabling harvest before fall rains or early frost and in time for planting small grain that fall. Sow 30 pounds of seed per acre February to April. ADAPTED CORN HYBRIDS

F5 N. C. 29 (White) A pure white, 2-ear hybrid with a white cob. A high yielder, comparable to N. C. 27 (yellow) except under conditions of a severe drought. Grain quality and weevil resistance are also about equal to N. C. 27. The two good ears per stalk are well protected by fairly tight shucks. N. C. 29 is slightly later than N. C. 27. Stalks are vigorous, stand well and moderately resistant to leaf spot and brown spot. The good qualities of this hybrid coupled with its white cob make it an excellent milling variety for the Coastal Plain where it is recommended. Prices: 7 lbs. (½ pk.) \$2.35; 14 lbs. (pk.) \$4.20, postpaid. Not prepaid, 7 lbs. \$1.75; 14 lbs. \$3.25; 56 lbs. (bu.) \$11.50.

C. 27 except under severe drought conditions. Grain quality is good with some variation in the color, good root and stalk strength. It is more susceptible to weevil than N. C. 27, moderately susceptible to leaf spot but more resistant to brown spot than N. C. 27. Recommended for both lower and upper Coastal Plain. Prices: 7 lbs. (½ pk.) \$2.35; 14 lbs. F27 N. C. 27 (Yellow) The most widely planted yellow corn in North Carolina and widely adapted and popular in South Carolina, Georgia, Alabama and Tennessee. While it is not the highest yielding yellow corn in every test, other qualities have won for it by far the greatest planter acceptance. Grain quality, shuck coverage, insect resistance and general good appearance and performance are some of these qualities. Root and stalk strength are good and the plants average 179 ears per 100 stalks. Medium maturity. N. C. 27 at its very best, treated, tested and graded is sealed in the Wyatt bags. F44 Kentucky 31 Fescue-Certified A tall or giant Fescue adapted to a wide variety of soils and uses. Like most long lived grasses, growth is slow after germination and should not be grazed until 6 inches high. Once established it promises to be the most versatile and valuable grass in a generation. It is the highest yielding grass in virtually every experiment station where it has been tried; is palatable and grows over a longer period each year than other grasses. This giant has a remarkable resistance to drought and its dense, deep roots make it ideal for erosion control, soil building, weed control, roadside planting, athletic fields, parks, airports, etc. In combination with suitable legumes it produces an excellent almost year 'round pasture. Because it has no underground root stocks it cannot become a pest and is readily killed by plowing. Continued high yields will require feeding, especially nitrogen which may be supplied partly by seeding with clover. Seed in a prepared, firm seed bed fall or early spring 15 to 20 lbs. per acre alone; 8 to 12 lbs. with 3 lbs. Ladino, White Clover, or 15 lbs. Lespedeza. Prices: lb. 70c; 2 to 9 lbs. @ 50c; 10 to 24 lbs. @ 37c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 30c; 25 to 99 lbs. @ 28c; 100 lbs. or more @ 26c lb.

F296 Combine Milo

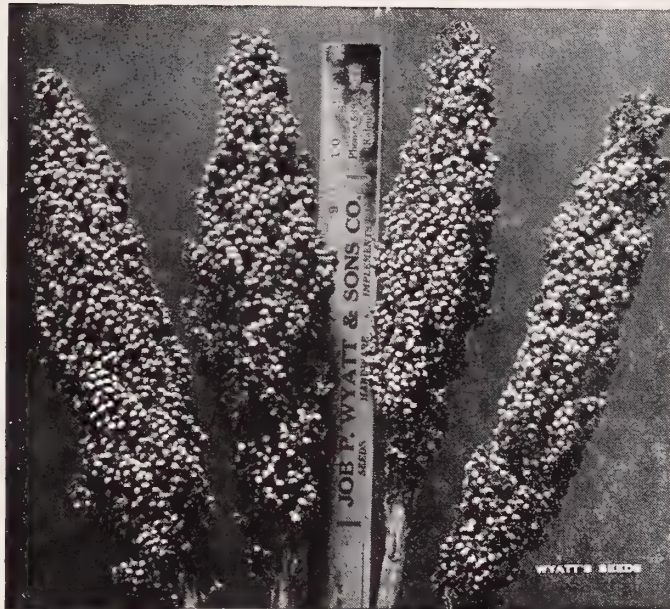

COMBINE MILO FOR GRAIN

F296 Martin's, Certified (Combine) Milo

This is the most satisfactory variety for all round Combine purposes in N. C. A superior plant for growing with peas for hay because of its low habit of growth. For grain it out yields corn and brings a higher price. Dry grain is ready in 110 to 120 days. Ready to cut for hay in 60 days. Plant 10 lbs. per acre in rows; broadcast 25 lbs. with peas or 50 lbs. alone. Prices: lb. 55c; 2 to 9 lbs. @ 35c; 10 to 24 lbs. @ 22c lb., postpaid. HEGARI

F197 Hegari Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Hegari has great forage value for two reasons. First because its high sugar content makes stalks and leaves highly palatable to livestock, and second, it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as is coming into more general practice, it is ground head, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: lb. 55c; 2 to 9 lbs. @ 35c; 10 to 24 lbs. @ 22c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 15c; 25 to 99 lbs. @ 12c; 100 lbs. or more @ 10c lb.

Not prepaid, 10 to 24 lbs. @ 20c; 25 to 99 lbs. @ 15c; 100 lbs. or more @ 12½c lb.

F186 Pearl, or Cat-Tail Millet One of the best and most nutritious of the continuous cutting green forage plants. Grows 8 to 10 feet high, but cutting can commence when it has attained the height of 3 to 4 feet, when it will stool out enormously and make rapid growth; can be cut in this way three to four times during the season. It does well even on poor land, and surprisingly well in dry seasons. Plant April to August, 6 to 8 lbs. to the acre in rows 3 feet apart. Prices: lb. 65c; 2 to 9 lbs. @ 45c; 10 to 24 lbs. @ 32c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 25c; 25 to 99 lbs. @ 20c; 100 lbs. or more @ 18c lb.

F304 Crotalaria, Giant Striata

STOCK PEAS

Owing to the present situation with respect to farm labor the supplies of peas especially pure varieties, are extremely limited.

F101 Brabham The seeds are smaller and do not require to be seeded as thickly as other kinds. It is disease-resistant, vigorous in growth, holds its foliage well, valuable for hay. Write for prices.

F109 Whippoorwill More largely grown than any other cowpeas, probably because of its long vine, usually six feet long, and its large yield of both hay and peas. Write for prices.

F111 Black Very prolific, early to mature, makes a fine growth. Write for prices.

F106 Taylor or Gray Crowder A large speckled pea that has a large, long pod. Matures early. See page 16.

F110 Clay Seeds medium sized and cream or clay colored. Vines grow long and leafy. Seed matures medium late. Write for prices.

F107 Iron This variety is noted for its disease-resistant qualities. Prices: lb. 45c; 5 lbs. \$1.35; peck \$3.25, postpaid. Not prepaid, 60 lbs. (bu.) \$8.50; 2 bu. bags or more @ \$8.00 bu.

For edible varieties see page 16

SOY BEANS

F146 Ogden Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seedings as late as June in the Wake County trials made a substantial production of hay. Average bean yield from 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and for that reason are more desirable for hay than the coarser growing types. Prices: 15 lbs. (pk.) \$2.50, postpaid. Not prepaid, 15 lbs. \$1.50; 60 lbs. (bu.) \$4.75; 2 bu. bags or more @ \$4.50 bu.

F150 Volstate A yellow seeded variety producing high yields of good oil beans. Plants are somewhat taller than Ogden and slightly less branched. For a hay crop or a crop that might be optional we would recommend Ogdens, but for a crop planted on light land and for combining we would recommend the Volstate owing to the height of the plant and the fact that the beans are somewhat bunched on the plant. Write for prices.

F143 Roanoke A new bean developed in the N. C. Experiment Station, U.S.D.A. Co-operating. Bean yield is higher than other popular varieties and the oil content of the bean is higher. Prices: 15 lbs. PEANUTS

CULTURE: Soils: Well drained sandy loam, properly limed, is best. Varieties: Virginia Bunch and Jumbo Runners in the old belt of North Carolina and Virginia. Spanish, North Carolina Runner or Virginia Bunch in the Southern Coastal plains and counties bordering the Piedmont using Spanish, Tennessee Red, or North Carolina Runner if in doubt as to the ability of the soil to make the larger varieties. In the Piedmont the Spanish variety is recommended. Smaller varieties produce more oil per ton of nuts, however, on adapted soils the larger nuts produce more oil per acre. Use 35 lbs. small varieties; 45 lbs. large varieties (shelled) per acre. Buy 1/3 more nuts by weight in the shell for the desired amount of shelled nuts. Field tests show 27 per cent increase in yield when seeds are treated with Arasan. Average of 22 tests conducted in North Carolina showed \$16.43 per acre increase return where peanuts were dusted 4 times with sulphur-copper dust, after deducting the cost of dusting.

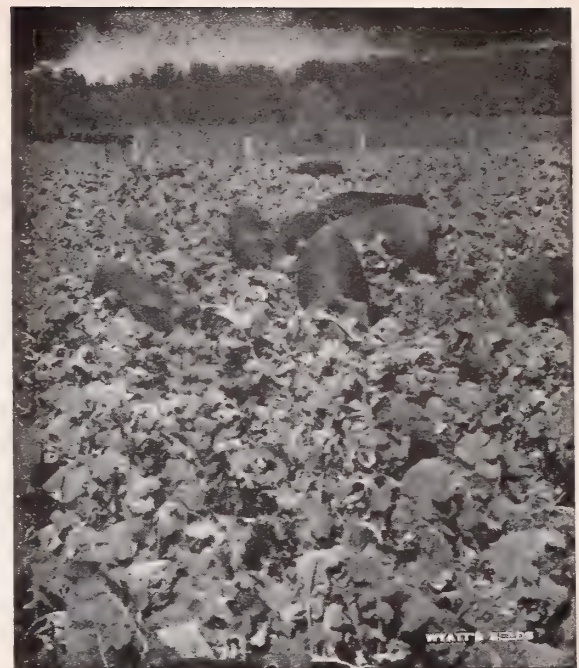

F221 Valencia Yields 600 to 700 pounds in shells. Adapted to a variety of soils and makes few "pops." Straight smooth pods contain 3 or 4 large kernels of finest quality, an early bunch variety. Prices: lb. 75c; 2 to 9 lbs. @ 53c; 10 to 24 lbs. @ 40c, postpaid. Not prepaid, 10 to 24 lbs. @ 33c; 25 to 99 lbs. @ 30c; 100 lbs or more @ 28c lb.

F224 Improved Spanish Yields 1,000 to 1,200 lbs. per acre in shells. This is the earliest of all peanuts, a bunch type, producing pods tightly filled with 2 kernels each. Highest in oil content and most dependable for varied soils. Strong roots attach nuts to plants and prevent loss in harvesting. Plant 6 inches apart in 18 inch rows for highest yields. Prices: lb. 75c; 2 to 9 lbs. @ 53c; 10 to 24 lbs. @ 40c, postpaid. Not prepaid, 10 to 24 lbs. @ 33c; 25 to 99 lbs. @ 30c; 100 lbs. or more @ 28c lb.

WYATT'S TOBACCO SEEDS

BLACK SHANK RESISTANT F279 Oxford 1, Certified

Resistant to Black Shank, a disease that attacks the larger roots and stalks, causing death rapidly. For best results plant on soils that have been planted to crops other than tobacco for at least 2 years. Recommended only for fields where Black Shank is known to be present. Does best on medium to light sandy loam soil types. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

F262 Oxford 1-181, Certified

Oxford 1-181 is a selection out of Oxford 1 made at the Pee Dee Experiment Station, Florence, S. C. This selection shows Black Shank resistance comparable to Oxford 1. However, heavy losses may occur where Black Shank is severe, especially if unfavorable soil and climatic conditions exist. For best results, a good rotation is very important where you have a disease problem. This variety is very similar to that of such medium broad leaf varieties as Virginia Bright Leaf and Bonanza. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

GRANVILLE WILT and BLACK SHANK RESISTANT F266 Dixie Bright 101, Certified

From information available, Dixie Bright 101 is the best in yield and value per acre of any variety having resistance to Black Shank or to Granville Wilt. This variety grows tall and normally produces broad and well proportioned leaves of medium length, the yield approaching that of 402. Since the crop grows with a yellow cast, it must appear well-ripened when primed; this is especially important so as to prevent the leaf from curing white. Dixie Bright 101 is not so severely affected by dry weather conditions which causes the plant to button prematurely, as is the case of some other varieties. Spacing should be 18 inches to 20 inches in the row and plants topped high.

Dixie Bright 101 has moderate resistance to Black Shank and high resistance to Granville Wilt. Suitable throughout the state where growers are using a rotation to keep the degree of Black Shank infestation down to some extent, or where both Black Shank and Granville wilt are present, or where Granville wilt alone is present. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

The Clip-Oil is a hand operated machine that will top your tobacco and prevent growth of suckers in one operation. At the same time the top is cut out of the tobacco with the Clip-Oil, a mineral oil emulsion is applied to the stalk. The oil emulsion prevents sucker growth and eliminates the need for suckering for the entire season. Clip-Oil is simple, yet it is constructed for years of satisfactory operation. The Agricultural Engineering Department of N. C. State College has tested and developed this machine to give the tobacco farmer the very best. Prices: \$25.25, postpaid. Not postpaid, \$24.75.

F261 Dixie Bright 102, Certified Probably the highest quality variety available today, having high resistance to Black Shank and Granville Wilt. A moderate yielder (about like Oxford 26 and Virginia Bright Leaf), usually produces cigarette tobacco nearly to the top of the plant, and can be cured to a rich lemon color. Dixie Bright 102 needs to be primed when mature and ripe and the temperature needs to be advanced early and rapidly as the leaf approaches the yellow stage. Otherwise the leaf sponges easily. With proper ventilation, the leaf will dry at a fairly low temperature and dries quickly. The variety is suitable throughout the state where Black Shank and Granville Wilt are present. The variety did show considerable susceptibility to ringspot in some cases where ringspot is a problem. Fertilize liberally on lighter soils. Space plants 16 inches to 18 inches in the row and top high. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

GRANVILLE WILT RESISTANT

F254 Oxford 26, Certified

Highly resistant to Granville Wilt, also showing some resistance to Fusarium Wilt. Recommended only for fields known to be contaminated with Granville Wilt. This strain is highly resistant, but for best results should be grown on soil rotated to other crops for 1 to 2 years. It can be planted closer together in the row for increased yield and the quality compares favorably with other varieties. Our seeds are chemically treated. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

F269 Dixie Bright 27, Certified

Has about the same degree of resistance to Granville Wilt as Oxford 26. No Black Shank resistance. Yields 200 to 400 pounds more per acre than Oxford 26. The variety is a strong feeder and care should be taken to avoid over-fertilization with nitrogen. Allow to become well-ripened before harvest. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

F267 Dixie Bright 28, Certified

Developed at the N. C. Agricultural Experiment Station from a cross of two Granville Wilt resistant lines. Each of these lines received its wilt resistance from T. I. 448A and have the varieties 400 and 401 as flue-cured parents. Consequently, D. B. 28 resembles the popular "400" group of varieties. It has the type and handling qualities farmers desire in flue-cured varieties. It is highly resistant to Granville wilt and also produces well, but it has no resistance to black shank. The long, broad leaves are medium closely spaced on the stalk. Its use will be limited to the areas where Granville wilt is the only problem. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

OTHER VARIETIES

F268 Hicks Broadleaf, Certified

Medium height, closely spaced leaves which are fairly long, moderately narrow and taper to a sharp point. This variety is very easy to cure to a bright flashy color and does best on medium soil types. Hicks is severely affected by unfavorable weather conditions, especially dry weather which will cause premature buttoning and narrow leaves. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

Destroys many surface seed-borne organisms and protects the seed against certain soil-borne organisms responsible for seed decay. Improves stands and frequently increases yield of quality crops. N. C. State College Bulletin 31 reports 27 per cent increase in Peanut stands. University of Illinois tests show 8.5 bushels per acre increased

yield of corn. Highly profitable on Soy Beans. Excellent reports on use of "Arasan" for many vegetables. $\frac{3}{4}$ oz. 35c; 8 ozs. \$1.25; 2 lbs. \$3.55; 10 lbs. \$12.30, postpaid.

ARASAN SF

Possesses the same fungicidal and insecticidal properties as Arasan. Arasan SF has been developed for large scale processors using the "slurry" method of seed treatment. Write for full details. See page 56 for "slurry" treaters. 3 lb. bag \$5.50, postpaid. Not prepaid, 3 lb. bag \$5.20.

ARASAN SF-X

A new dustless and odorless seed disinfectant. This is good news to commercial seed treaters and farmers. Arasan SF-X will not dust off. The farmers will not be troubled with dust when planting seed. F • T • E
(Fritted Trace Elements)
 Trace elements are required by plants for healthy growth and a deficiency may cause such abnormal effects as yellowing of foliage, stunting of growth, and distortion of leaves. Ferro FTE contains essential trace elements and is for use as a soil mineralizer to prevent or correct soil deficiencies of manganese, iron, zinc, copper, boron and molybdenum. It is slowly soluble and remains in the soil for several seasons providing trace elements for good plant growth. Ferro FTE is not injurious to plants and overdosage presents no hazard. It should be used to supplement commercial plant foods containing nitrogen, phosphorus and potassium; it does not replace fertilizer.
